# Software Configuration Instructions for Digital Doc Iris Intraoral Camera and Kodak Dental Imaging

In Kodak Dental Imaging, select **New intraoral camera image** under **File** in the menu bar or by selecting the icon in the toolbar. (Alternatively, you can press F5 or the capture button on your camera)

Some Additional Notes on Kodak Installations...
• If you are unable to open the video window in Kodak Dental Imaging, please verify your software license includes this feature. It will be listed as either STV or intraoral camera in **?** > **View License** > **License Details**.
• If the component is licensed, you may need to install drivers for the **Kodak1000 camera** or **third party capture card** (if the Kodak1000 is not listed). This has to be done from the KDI installation disc. Run the file **SetupSTV.exe** located in the folder named **Drivers\Stv_Pro_2** on your disc.
• If moving the camera between multiple workstations, you may want to install the Plug and Play service from the Iris Installation disc. Run the file **InstallPnP.exe** located in the **KDI_Empia_PnP** folder on your disc. Reboot system to start service.

If the camera option is unavailable, select **Options** then **Preferences**. Below the camera tab, be sure the "Use a video capture source" box is checked. If not, check the box, then restart your software.

Click on the gear icon on the right side of the video window. Select **Iris** from the dropdown list of installed video devices.
Click on the default button to the right of the video settings sliders.

Once you have a live video feed in the video window, pressing the capture buttons on the camera will alternate between freezing the video frame and saving the frozen image.
